Background

Beginning in 1997, the Centers for Disease Control and Prevention (CDC) created the Prevention Epicenters Program, which works to implement innovative strategies to improve healthcare quality and patient safety. The program works with a network of academic medical centers to address scientific questions through research regarding prevention of healthcare-associated infections, antibiotic resistance, microbiome health, and other healthcare-associated adverse events.

The CDC has funded 11 Epicenters:

- University of Iowa Carver College of Medicine
- University of Utah School of Medicine
- Harvard Pilgrim Health Care and University of California at Irvine
- University of Chicago
- Chicago Prevention and Intervention Epicenter
- University of Pennsylvania
- Johns Hopkins University
- University of Maryland School of Medicine
- Duke University and University of North Carolina
- Emory University
- Washington University
- University of Illinois at Chicago
- University of Iowa Carver College of Medicine
- Harvard Pilgrim Health Care and University of California at Irvine

Of the many areas of study for each Epicenter, some of the noteworthy areas are:

- Managing antibiotic stewardship
- Prevention of surgical site infections
- Minimizing risk of disease transmission when removing personal protective equipment
- Optimal cleaning of hospital environment
- Developing and testing methods for effective healthcare worker training
- Improve compliance with glove use and hand hygiene during patient care
- MRSA colonization
- Transmission of infections in households
- Epidemiology and transmission dynamics of C. Difficile

The CDC awarded $26 million in grants in 2016 to support the Prevention Epicenters Program. This allowed for five additional academic medical centers to play a part in this patient safety effort.

If you have any questions about this policy proposal, please send an email to grassroots@shea-online.org
The Society for Healthcare Epidemiology of America urges Congress to increase topline funding for the CDC to ensure the sustainability of the Prevention Epicenters Program.

These centers hold an integral role in research in best practices to prevent transmission of healthcare-associated infections and preventing the spread of antibiotic resistance.

Funding for the Prevention Epicenters represents some of the most concentrated research funding dedicated to patient safety that will lead to the transformation of the delivery of healthcare saving money in the US healthcare system and improving outcomes for patients wherever healthcare is delivered.
